# Labbiah

Known Constraints

Labbiah is designed around six physical buttons on the phone case rather than touch. That trade-off is deliberate, but it puts three real limits on what the app can do today.

1

## No keypad, so no typing

There is no on-screen or physical keyboard anywhere in the app. As a direct result: messages cannot be composed inside Labbiah (Messages hands off to the phone's own SMS app once a contact is picked), contacts cannot be added manually, and the contact list cannot be searched by name or number. Every interaction is limited to picking from what's already on screen.

2

## No dedicated OK / Select button

The case has six keys: Call, Home, Hang-up, Up, SOS, Down. There is no separate confirm button, so the green Call key doubles as "select the highlighted item" everywhere in the app -- opening a Home tile, opening a contact's detail page, or placing an actual call, depending on context. It always looks and behaves like the same key, whether or not a call is about to happen.

3

## No dedicated Messages button

Unlike SOS, which has its own hardware key that works from any screen, Messages has no physical shortcut. It's only reachable by navigating to the MESSAGES tile on the Home screen with Up/Down and confirming with Call.
